

**REMARKS**

Claims 1-61 are pending in the application and stand rejected.

**Claim objections**

Claim 42 stands objected to for an alleged grammatical ambiguity perceived by the Examiner. Applicants respectfully disagree and insist that the language of the claim is clear and correct and respectfully request the Examiner to withdraw this objection as it appears to be based on nothing more than the Examiner's own stylistic preferences.

**Rejection under 35 U.S.C §101**

Claims 1, 6, 7, 24 and 42 stand rejected under 35 U.S.C. 101 in view of the Examiner unexpected (given that this is the fourth time he has examined the very same claims) announcement that "the claimed subject matter is merely drawn to a collection of data fields – for example, the integrity metrics and trust levels (e.g., level 1, 2 and so on) which are merely non-functional descriptive material and as such the claimed subject matter fails to produce the useful and tangible results." Applicants respectfully disagree.

Claim 1 is directed to a computer apparatus that comprises two devices: a receiver, and a controller. As immediately apparent to anyone skilled in the art and furthermore made abundantly clear in the specification, these hardware devices operate in accordance with their specific programming, and it is the novel and inventive tasks that this programming must carry out in accordance with the present invention that are recited in the claims (e.g., for the receiver, receiving an integrity metric for a computer entity via a trusted device associated with the computer entity). The claim does not recite any hardware characteristics for either of these components because they are irrelevant to the invention, as those skilled in the art will readily recognize.

Similarly, claim 6 is directed to a method that recites specific actions such as receiving and assigning. The balance of the claims are also directed to either an apparatus or a method,

either of which have been addressed above. Applicants thus respectfully submit that the Examiner's opinion is simply not tenable in view of the plain language of the claims, that the Examiner is clearly ignoring clearly recited claim elements, and request the Examiner to kindly reconsider and withdraw this rejection.

Rejection under 35 U.S.C §103

Claims 1-9, 11-19, 22-26, 28-37, 42-44, 46-55, 60 and 61 stand rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Pat. No. 6,415,280 to Farber et al. in view of U.S. Pat. No. 6,678,833 to Grawrock. Applicants respectfully disagree, as elaborated upon below.

With respect to Applicants' claim 42, the Examiner alleges that Farber teaches all of the claimed limitations with the exception of disclosing expressly the trusted device, asserts that Grawrock's TPM "is considered as the trusted device," and opines that it would have been obvious to the skilled person "to combine the teaching of Grawrock within the system of Farber because (a) Farber teaches providing a resource integrity checking mechanism by validating the integrity metric stored at the remote trusted party and the one reported by the local processor... and (b) Grawrock teaches the integrity metric reported by the local processor should be carried out by the trusted device to ensure the reported data is indeed trustworthy without the reliance on any intervening devices." As in previous Actions, the Examiner once again combines references in a disjointed and self-contradictory manner that is simply not supported by the references themselves.

Applicants note, once again, that claim 42 very specifically recites that the integrity metric is (a) calculated for the entity by the trusted device and (b) containing values indicative of one or more characteristics of the entity. Presently, the Examiner states (1) that Farber teaches such an integrity metric because "the True Name – i.e. the MD (Message Digest), signature/hash value, of a data block – is interpreted as the integrity metric," and (2) that Grawrock also teaches precisely the same integrity metric at col. 2 ll. 5-6 and col. 4 ll. 7-9: "the hash value." The Examiner is (A) wrong on both accounts, and (B) self contradictory.

(A) (1) Farber is directed to method for delivering content or data items that are distributed across a network. These items of data are given "true names" based upon a digest of the data item itself; as the Examiner himself acknowledges, "the True Name – i.e. the MD (Message Digest), signature/hash value, of a data block – is interpreted as the integrity metric." Thus, the alleged "integrity metric" disclosed by Farber clearly is not (a) calculated for the entity by the trusted device because there is no trusted device taught by Farber as acknowledged explicitly by the Examiner, nor (b) containing values indicative of one or more characteristics of the entity because the true name of Farber is a digest of a data item and has nothing whatsoever to do with the computer entity that may be holding that item or any other computer entity

(A) (2) The hash value taught by Grawrock at col. 2 ll. 5-6 is nonexistent (this passage discusses binding the TPM to a boot memory block), and at col. 4 ll. 7-9 is limited to the following cryptic passage: "these modules 340, 350 and 360 can undergo a hash operation to produce corresponding identifiers 345, 355 and 365 for later use in verification by a challenger." There is absolutely no mention anywhere else in Grawrock of these identifiers 345, 355 and 365. Furthermore, the Examiner once again insists on equating Grawrock's TPM with the claimed trusted device, forcing the Applicants to once again ask: what then corresponds to the claimed computer entity with which the TPM is associated? Applicants submit, once again, that there is nothing in Grawrock that teaches, explicitly or even implicitly, (a) that the TPM, regardless of whether it is trusted or not, is associated with a computer entity and that it calculates an integrity metric for this nonexistent computer entity, nor (b) that the alleged integrity metric ("hash value") containing values indicative of one or more characteristics of the (nonexistent) computer entity.

(B) The Examiner alleges that both Farber and Grawrock teach the claimed integrity metric. As discussed immediately above, the disclosures relied upon by the Examiner in the two references are directed to completely different items: a digest of a data item, and the result of a "hash operation" on a software module. Thus, Applicants are forced to ask: which one is it, really? These two items have nothing in common, and to allege that they both disclose the same claimed element only belies the Examiner's position.

The above is only reinforced by the alleged motivation offered by the Examiner to attempt to combine the two references. The Examiner's reasoning that "(a) Farber teaches providing a resource integrity checking mechanism by validating the integrity metric stored at the remote trusted party and the one reported by the local processor... and (b) Grawrock teaches the integrity metric reported by the local processor should be carried out by the trusted device to ensure the reported data is indeed trustworthy without the reliance on any intervening devices" is, once again, self contradictory. How can Farber teach "validating the integrity metric stored at the remote trusted party and the one reported by the local processor" if there is no trusted party in Farber, as very clearly acknowledged by the Examiner? Furthermore, what does this "resource integrity checking mechanism," which is clearly directed to verifying the integrity of data items, have to do with an integrity metric calculated for a computer entity by a trusted device associated with the entity and containing values indicative of one or more characteristics of the computer entity?

As for the Examiner's assertion that "Grawrock teaches the integrity metric reported by the local processor should be carried out by the trusted device to ensure the reported data is indeed trustworthy without the reliance on any intervening devices," Applicants can only reply, huh? What "reported data?" What data? Reported by what to where? What local processor? The hash operation on the software modules of the TPM (the alleged "trusted device") is clearly carried out by the TPM itself, so once again, what in Grawrock is the computer entity that the trusted device/TPM is associated with? Is it this "local processor" and if so, what/where is it?

This is the fourth office action issued by the Examiner in what has become an extremely costly effort for Applicants, both in financial terms and the remaining lifetime of any patents that will ultimately issue off this application. The Examiner insists on interpreting claim terms in ways that are clearly against the teachings of the specification, the meaning generally accepted in the art, and oftentimes against common sense itself. Any further delay of this application caused by the Examiner's obvious failure to fully and completely read the present application as well as the cited prior art documents will be met with the strongest possible reply at the highest administrative levels of the PTO. Applicants have expended more than sufficient resources and period of protection in attempt after attempt to educate the Examiner and patiently explain what is only too apparent to one reading the specification. Applicants once again, and strongly,

demand that the Examiner read the claims – carefully, read the specification – thoroughly, read the prior art on record – fully, reconsider, and pass claim 42 to issue.

The Examiner appears to reject claims 1, 6, 7 and 24 on the same exact basis as claim 42. This is not only incorrect, as shown above, but insufficient given that these claims contain limitaitosn that are not found in claim 42 and which the Examiner does not deign to address. Claim 7, for instance, recites requesting a trusted device associated with a computer entity to provide an integrity metric calculated for the entity by the trusted device and containing values indicative of one or more characteristics of the entity; receiving a response from the trusted device including an integrity metric calculated for the entity by the trusted device; comparing values in the integrity metric calculated for the entity by the trusted device with authenticated values provided for the entity by a trusted party; and selecting a level of trust for the entity from a plurality of predefined levels of trusts based on at least one value in the integrity metric calculated for the entity by the trusted device. As already shown above, there is no disclosure related to anything akin to the claimed integrity metric in either Farber or Grawrock. This omission notwithstanding, Applicants further ask, where does either reference teach the claimed requesting such an integrity metric? Receiving the response? Comparing received with authenticated values? Selecting a level of trust based on at least one received value? Yet again, Applicants plead with the Examiner to read the claim in its entirety and yet again, submit that claim 7, as well as claims 1, 6 and 24, are allowable over the art for, *inter alia*, the same reasons as those set forth in proving the allowability of claim 42, and respectfully urge the Examiner to pass these claims to issue as well.

Claims 2-5 depend from claim 1, 8-23 depend from claim 7, claims 25-41 depend from claim 24, and 43-61 depend from claim 42. “If an independent claim is nonobvious under 35 U.S.C. 103, then any claim depending therefrom is nonobvious.” *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988). Therefore, in light of the above discussion of claim 42, Applicants submit that claims 2-5, 8-23, 25-41 and 43-61 are also nonobvious and allowable and therefore are not individually addressed elsewhere herein.

In view of the above, Applicants submit that the application is now in condition for allowance and respectfully urge the Examiner to pass this case to issue.

The Commissioner is authorized to charge any additional fees which may be required or credit overpayment to deposit account no. 08-2025. In particular, if this response is not timely filed, the Commissioner is authorized to treat this response as including a petition to extend the time period pursuant to 37 CFR 1.136(a) requesting an extension of time of the number of months necessary to make this response timely filed and the petition fee due in connection therewith may be charged to deposit account no. 08-2025.

I hereby certify that this correspondence is being deposited with the United States Post Service with sufficient postage as first class mail in an envelope addressed to: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450 on
